

LIST OF MARINE SHELLS COLLECTED IN THE NEIGHBOURHOOD
OF ADEN BETWEEN 1892 AND 1901.

By Commander E. R. SHOPLAND.

Read 14th March, 1902.

THE shells enumerated in the following list were, with the seven exceptions noted, collected within a radius of six miles from Steamer Point, Aden, chiefly on the shores of the Inner Harbour, by dredging in from three to eleven fathoms in and south of the harbour, and from the coral brought in from Little Aden for making lime.

All the species marked with an asterisk (*) have been described from types now in the British Museum (Natural History).¹

In compiling the list it has been considered advisable to follow a well-known work rather than attempt the almost hopeless task of adjusting the nomenclature to the latest standards. This list has therefore been drawn up in accordance with the "Catalog der Conchylien-Sammlung von F. Paetel."

CEPHALOPODA.

Argonauta tuberculosa, Lk.

GASTROPODA.

<i>Ianthina fragilis</i> , Lk.	<i>Pisania Crosseana</i> , Souverb.
<i>Murex anguliferus</i> , Lk.	" <i>ignea</i> , Gmel.
